

You are using a cracked version of Surpac 6.3, which is vulnerable to any bug that exists in the latest release. This will make your job as a storm water engineer difficult as you may be unable to reproduce what is happening with the system and it will cause anxiety among those charged with maintaining the system during operation. It also makes it difficult to provide accurate reports on what's going on with the system and how it is operating. Please spend some time learning about engineering software before you invest in costly licenses and be careful when downloading free versions of engineering software from unknown sources online. Stay safe out there. I would like to know how to install the product, as I'm very new to this software and it looks very complicated. Is there anyone who can share a download link for the newest version of Surpac (the one with the N/A) and possibly an installation guide. I am interested in obtaining the Gemcom Surpac software for use with MODFLOW models. I was disappointed to learn that it is not free anymore and I believe that I will not purchase it at all if you will not make available for free for academic use, such as mine (I'm a PhD student studying groundwater). Thanks for your reply. I am looking for "Surpac 6.3 with CA N/A". I am interested in using the software to run sequencing batch reactor (SBR) models, simulating organic contaminants (PCBs) and inorganic contaminants (dissolved metals) leaching from either open or closed landfills or hazardous waste sites. Is this version of Surpac available for free? In addition to not being able to obtain the software from any legitimate sources, there is no manual available online from which to learn how to use it. This is a major stumbling block when attempting to learn the software on your own, as it appears you must do if you choose to use it without purchasing a license key. I'm willing to pay for it if it is not free and I like the software. But why don't you make it available as a free download? I am a PhD student and I would like to use your software for modeling water pollution in SBRs under real conditions. Please provide me with the link for this product. I am currently developing an internship project at NCEAS (Center for Public Health and Environmental Justice) and will be using this software to model microbial activity in open landfills. Is the software available as 'Free' or can we purchase it? I'm interested in obtaining the Gemcom SURPAC 6.3 to run MODFLOW model. I was disappointed to learn that it is not free anymore and I believe that I will not purchase it at all if you will not make available for free for academic use, such as mine (I'm a PhD student studying groundwater). I am interested in obtaining the Gemcom Surpac software for use with MODFLOW models. I was disappointed to learn that it is not free anymore and I believe that I will not purchase it at all if you will not make available for free for academic use, such as mine (I'm a PhD student studying groundwater). How can i install surpac? How do i install surpac 6.3 pls help me
