The more data you use and the more RAM you have, the better..The results showed that daily exposure to beaver dam waters was associated with significantly lower urinary.Q: Create a filter on existing data Hi I'm trying to create a query where it looks for records which contains the word'surgeon' in them, I have tried the code below and it does not work it only returns the code inside the IF statement and not the whole record. Private Sub CommandButton1_Click() Dim LastRow As Long Dim strSQL As String Dim rs As Recordset Dim strConnection As String strConnection = "Provider=Microsoft.ACE.OLEDB.12.0;" & _ "Data Source = C:\Users\Hank\Desktop ew folder\surgeon list.accdb;" & _ "Persist Security Info = False;" & _ "User ID = Admin;" & _ "Initial Catalog = surgeon list;" & _ "Extended Properties = 'excel 12.0;HDR=YES;IMEX=1;'" Set rs = CurrentDb.OpenRecordset("select * from [surgeon list]") 'This is for the Code that creates a filter to only return records that contain the word'surgeon' in them. Dim myFil As String Dim strCount As Long myFil = "*" & "surgeon" & "*" strCount = rs 82157476af
